

FOR IMMEDIATE RELEASE

RMH Studios Names Alex Wu as Chief Uptime Officer

Appointment formalizes leadership of platform reliability following a stretch of near-perfect uptime across the studio's web, realtime, and data services.

RMH STUDIOS | Effective immediately | rmhstudios.com

RMH STUDIOS today announced the appointment of **Alex Wu** to the newly created role of **Chief Uptime Officer (CUO)**. In the position, Wu will hold company-wide responsibility for the availability, latency, and resilience of every service RMH Studios ships — from the main website to its realtime game infrastructure and data layer.

The announcement coincides with one of the strongest reliability windows in the studio's history. Across the most recent monitoring period, RMH Studios' public-facing website and primary PostgreSQL database both recorded **100.00% uptime**, while every realtime service held above **99.1%** — all while serving requests in the single-digit-millisecond range.

Under the new structure, Wu will own the studio's status page, incident response, and reliability targets, and will report on platform health directly to leadership. The role consolidates oversight that was previously distributed across the engineering team into a single, accountable mandate.

“Uptime isn't a dashboard color — it's a promise. When someone hops into RMHbox on a Friday night or starts a watch party on RMHtube, they shouldn't have to think about whether it'll work. It just works. My job is to keep that promise boring, because boring is what trust looks like at three milliseconds.”

— Alex Wu, Chief Uptime Officer, RMH Studios

Wu added that the team's near-term focus will be hardening the realtime WebSocket fleet — including RMHbox and RMHtube — and tightening the recovery window on the daily recap scheduler, with the goal of pushing every service toward four-nines availability.

PLATFORM SNAPSHOT AT TIME OF ANNOUNCEMENT

SERVICE	LATENCY	UPTIME	STATUS
Website Main rmhstudios.com web app	13 ms	100.00%	Operational
Realtime / Games Socket.IO server (multiplayer + live apps)	4 ms	99.71%	Operational
RMHbox Party-game WebSocket server	3 ms	99.32%	Operational
RMHtube Watch-together WebSocket server	3 ms	99.12%	Operational
Recap runner Lights Out daily recap scheduler	3 ms	99.12%	Operational

SERVICE	LATENCY	UPTIME	STATUS
Database PostgreSQL (via Prisma)	2 ms	100.00%	Operational

ABOUT RMH STUDIOS

RMH Studios builds multiplayer and live social experiences, including the RMHbox party-game platform and the RMHtube watch-together service. The studio operates its products on a realtime stack of Socket.IO and WebSocket servers backed by a PostgreSQL database, and publishes service health openly via its public status page.
